Appendix A3: Robustness checks

One possible concern regarding our measure of ethnicized group perceptions is that it might underestimate the ethnic imprinting of students' clique perceptions due to social desirability. Some students might not have used an ethno-racial label to describe a group of fellow students in their grade, even though it came to their mind immediately. Although the discourse on anti-racism is not as advanced in Germany as in the United States or Great Britain (Juang et al. 2021), it is still possible that some students engaged in such cognitively controlled and motivated non-reporting.

To address this potential problem, we conducted two robustness checks that replicated our analysis in subsamples in which social desirability tendencies should be much less pronounced if this was a driving force in students' response behavior. First, we contrasted different types of secondary schools in our sample. In Germany's highly stratified school system, students are channeled into different types of secondary schools around the age of 10, largely based on school performance in elementary school (Allmendinger 1989; Schindler 2017). Whereas the higher secondary schools and comprehensive schools are more demanding academically and allow students to attain a degree which directly allows for entry into higher education, the lower-track schools conclude 2-3 years earlier and traditionally prepared students mainly for vocational training. Given this difference in academic orientation and the strong socio-economic gradient that characterizes this dividing line, students in the lower and intermediate secondary schools ("Hauptschule" and "Realschule") can be expected to be considerably less motivated by political correctness and social desirability. Hence, to the extent that social desirability is an issue, we should at least see ethno-racial labels to be more frequently used by students at these schools. As shown in Table A3, however, there is no systematic difference in the use of ethno-racial labels across these types of secondary schools.

In a second robustness check, we examined whether the use of ethno-racial labels varies systematically depending on how strongly students embrace cosmopolitan statements. As part of our survey, we asked students to what extent they agree with the following two statements: "I am happy when I meet people from other countries." and "The country a person comes from does not matter to me." Students who agree strongly with both of these items (4 or 5 on a 1 to 5 Likert scale) either hold strong cosmopolitan attitudes or feel urged to answer in this way due to the perceived social desirability of such beliefs. This is true for about 70% of respondents (2013 out of 2891). In comparison, the remaining 30% of respondents seem to have no problem in reporting attitudes that qualify or contradict a full embrace of cosmopolitanism. However, as shown in Table A3, even in this subgroup, the prevalence of ethno-racial labels is very low. Taken together, the results of both robustness checks suggest that our finding of a low prevalence and salience of ethno-racial labels is not mainly driven by social desirability.

Table A3. Use of ethno-racial labels by school type and agreement with cosmopolitan statements

| | School types | | Cosmopolitan statements | |
|---------------------|------------------------------|---------------|-----------------------------|----------------|
| | Lower and | Upper and | No strong | Strongly agree |
| | intermediate | comprehensive | agreement | (32%) |
| | | | (68%) | |
| Prevalence of | 0.0362 | 0.0313 | 0.030 | 0.036 |
| ethno-racial labels | | | | |
| t test | p-value= 0.59 ; $t = 0.54$ | | p-value = 0.54, t = -0.61 | |

Note.— † p < 0.10 * p < 0.05 ** p < 0.01 (two-sided). Here, we used the part of the sample that reported at least one qualitative group description (N=1849). Numbers depict the shares of students in this sample reporting an ethnoracial label.
